

OPS-012 | Severe Weather Procedure

Weather-aware risk assessment, safety precedence, and operational response.

Document ID	OPS-012
Version	1.0
Department	Logistics Operations
Owner	Network Operations Lead
Effective date	2026-08-01
Review cycle	Seasonal
Classification	Internal - Demo

Training Notice

This is a fictional internal policy created solely for portfolio development, testing, retrieval, and RAG evaluation. It does not describe the policy of any real carrier, customer, or logistics company.

1. Purpose

Define how Logistics Operations should assess and respond to severe weather that may affect shipment safety, service reliability, or route feasibility.

2. Weather signals used by the demo system

The AI Logistics Copilot may use external weather data as contextual evidence. Weather data informs risk; it does not automatically authorize route changes.

Signal	Operational interpretation
Precipitation probability >= 20%	Contributes to delay-risk context when the shipment is already operationally vulnerable.
Wind speed >= 50 km/h	Contributes to delay-risk context and may warrant carrier confirmation.
Official severe-weather restriction	Treat as authoritative operational constraint when confirmed by a trusted source.
Forecast only, no operational impact	Monitor; do not assume a delay has occurred.

3. Assessment workflow

- Identify the shipment route segment and next milestone.
- Check the latest operational event before interpreting weather.
- Compare the expected milestone time with the weather window.
- Confirm whether the carrier has issued a restriction, service alert, or revised ETA.
- Calculate or refresh operational risk using deterministic rules.
- Apply the escalation policy if risk reaches HIGH.

Weather alone should not be presented as the confirmed cause of a shipment delay unless the carrier or another trusted operational source confirms the causal relationship.

4. Response levels

Level	Condition	Action
Watch	Forecast risk exists but no confirmed operational impact.	Monitor next milestone and refresh weather as needed.
Impact likely	Weather overlaps route/milestone and carrier performance may be affected.	Request carrier confirmation; prepare customer-impact assessment.
Confirmed disruption	Carrier restriction, closure, cancellation, or missed milestone is confirmed.	Apply delay procedure and calculate risk.
Severe / HIGH risk	Confirmed disruption plus HIGH operational risk or safety concern.	Supervisor review within 30 minutes; evaluate approved recovery options.

5. Safety precedence

Safety restrictions take precedence over delivery speed. No user or AI recommendation may instruct a carrier, driver, or warehouse to ignore official safety restrictions or unsafe operating conditions.

6. Customer communication

When weather affects a customer commitment, communicate only confirmed facts. If an updated delivery time is uncertain, provide the next planned review time rather than inventing a precise ETA.

7. Route or carrier changes

Rerouting, carrier substitution, premium recovery, or delivery-window changes require explicit human approval because they may affect cost, contracts, safety, or customer commitments.

8. Example

SHP-1010 is already delayed with an expired ETA and stale shipment events. The weather service reports precipitation probability above 20% and wind above 50 km/h along the relevant route. These weather signals may contribute to the deterministic risk score, but the Copilot must not state that weather caused the delay unless a trusted operational source confirms it.

9. Data quality and fallback

- If weather data is unavailable, continue the operational assessment using shipment data and clearly state that weather context is unavailable.
- If location is ambiguous, do not attach weather from an unrelated location.
- If multiple forecasts disagree, present the uncertainty and rely on authoritative operational restrictions when available.
